MILITARY SPECIFICATION

DATA BASE, REVISABLE:
INTERACTIVE ELECTRONIC TECHNICAL MANUALS, FOR THE SUPPORT OF

This specification is approved for use by all Departments and Agencies of the Department of Defense.

1. SCOPE.

1.1 <u>Scope</u>. This specification prescribes the requirements for an Interactive Electronic Technical Manual Data Base (IETMDB) to be constructed by a weapon-system contractor for the purpose of creating Interactive Electronic Technical Manuals (IETM). The requirements herein cover the specification for the IETMDB and are intended to apply to one or both of two modes as specified in a contract: (1) the interchange format for the data base to be delivered to the Government; or (2) the structure and the naming of the elements of the data base created and maintained by the contractor for purposes of creating IETMs which are in turn delivered to the Government.

1.2 <u>Paragraphs with limited applicability</u>. This specification contains paragraphs and specific requirements which are applicable to all Services. Such paragraphs or requirements are prefixed to indicate the Services to which they pertain: (A) for Army; (N) for Navy; (M) for Marines; and (F) for Air Force.

> Beneficial comments (recommendations, additions, deletions) and any pertinent data which may be of use in improving this specification should be addressed to: HQ AFMC/ENCS, Wright-Patterson AFB, OH 45433-5001; by using the self addressed Standardization Document Improvement Proposal (DD Form 1426) appearing at the end of this document, or by letter.

Distribution Statement A. Approved for public release; distribution is unlimited.

1.3 Introduction. The following introductory material is included in this specification in order to fully acquaint offering contractors with the new requirements and characteristics of a data base developed specifically for IETMs.

1.3.1 Nature and purpose of a revisable source data base. For complex weapon systems and other types of military equipment, adequate logistic support in all its forms requires an enormous amount of current, readily accessible, accurate, and highly detailed data, consisting of Technical information (TI). This information has been traditionally prepared and distributed to the end user in paper form; but with new technology it can be better and more effectively displayed or presented electronically and interactively to an end user. The material presented is derived from material stored in textual, graphical, audio, or video form in a revisable data base which is composed of logically connected but randomly accessible IETM data elements. It is this starting point of the IETM electronic data chain that is specified in this document. The concept that the Services can either acquire and maintain large scale data bases of this type, or acquire access to such data bases, maintained continuously by a contractor, is an integral part of the IETM concept and in the larger arena of the Department of Defense (DoD) Computer-aided Acquisition and Logistic Support (CALS) program.

1.3.1.1 IETMDB capabilities. An IETMDB is a complete collection of data base elements relating to a weapon system or other equipment acquired by the Government and constructed in a standardized manner in order to provide the following capabilities:

a. The IETMDB can serve as the basis for construction and update of the entire suite of weapon system electronically displayed IETMs through the use of automated authoring systems.

b. Government activities or DoD contractors concerned with logistic support for the weapon system involved can access the data base directly to obtain needed logistic support information for specific purposes.

c. The IETMDB, or portions of it, can be interchanged by means of standardized formats and procedures throughout the DoD and its supporting contractors when needed for any purpose.

1.3.2 Technical information procurement options. Acquisition of IETMs may be carried out by one of several optional approaches. This specification provides requirements for a standardized IETMDB which will permit the Government to acquire TI by applying any of the following contractual options:

a. Acquisition of only the final form IETMs which are required.   Although the author (equipment prime contractor) will need to establish an automated equipment or weapon-system (source) data base, this data base will not be acquired by the Government, but will be maintained, used, and controlled by the contractor, both for the preparation of IETMs and for other purposes. The Government under this specification requires that the data base

be structured and the individual data elements named and attributed in a standard manner. However, an explicitly tagged data file need not be prepared for delivery as no data base delivery is required.

b. Acquisition of the IETMDB. Acquisition of the IETMDB may involve either of the following options:

   (1) Delivery to the Government in standardized form and subsequently maintained by the Government (with or without update information supplied on a continuing basis by the contractor).

   (2) Title acquired to the IETMDB by the Government, but with the data base retained and maintained in standardized form in the contractor's plant. The Government could be provided with on line access to the data base.

c. Acquisition of fully constructed IETMs (fully prepared and validated by the contractor), as well as the IETMDB upon which they are based. Acquisition under this option may involve either option (1) or (2) as given in 1.3.2b above.

1.4 <u>Format free technical information</u>. The IETMDB will consist of an assemblage of data elements, including a listing of the specific attributes possessed by the data elements; and a list of explicit relationships providing logical links among the data elements. The relationships incorporated into the data base by the IETMDB author provide the basis of the technical structure of the IETMs and other logistic support TI which will be extracted from it. The IETMDB will not, however, contain format directions in the sense of arrangement of text and graphics on a display screen for presentation to the end user. The IETMDB itself will, of course, require a "format" (data base structure) but this specification does not impose structural requirements on the actual Data Base Management System (DBMS) methodology to be employed (e.g., the data base may be either relational or object oriented). The exterior view of the data base to be used for updating, adding cross references, producing tagged output files, etc. must conform to requirements of this specification.

1.4.1 <u>Data portability</u>. Elimination of formatting requirements for the IETMDB reduces the overall magnitude of data base and data interchange standardization effort, and permits use of a less complex DBMS by the contractor which is, in turn, less expensive and easier to modify. The "format-free" nature of the IETMDB is intended to provide the Government the capability to:

a. Acquire or access the data in a variety of ways (IETMs, other types of logistics reports; training TI, etc.);

b. Subsequently format and style the data in a variety of ways for electronic display options.

1.4.2 <u>Integration support</u>. Since one of the functions of the IETMDB is to provide direct on line data access to a variety of users and to a number of automated logistic support and management information systems throughout the Services, establishment of standard identifiers, data entity relationships, and multiple path access routes to individual data elements is an important part of IETMDB design and construction.

2. APPLICABLE DOCUMENTS.

2.1 <u>Government documents</u>.

2.1.1 <u>Specifications, standards and handbooks</u>. The following specifications, standards and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issues of these documents are those listed in the issue of the Department of Defense Index of Specifications and Standards (DODISS) and supplement thereto, cited in the solicitation (see 6.2).

3.   REQUIREMENTS.

3.1   General requirements. An IETMDB developed in accordance with this specification shall conform to the Content Data Model (CDM) specified herein. The CDM employs a two layered approach to define technical information. The top layer, called the "Generic Layer", defines the semantic rules for the data characteristics. The generic layer is defined in Appendices A and C of this specification. The bottom layer, called the "Content Specific Layer", employs the generic layer when defining elements for weapon system specific TI. Appendices B and D contain a content specific layer model developed for organizational level maintenance. Many content specific layers can be developed in accordance with the generic layer. The CDM generic layer defined in Appendices A and C of this specification will be the DoD standard for any data base of IETM technical information procured using this specification. In addition, unless otherwise specified by the procuring activity, the content specific

layer defined in Appendices B and D of this specification shall also be part of this specification (see 6.2). If Appendices B and D of this specification are not specified by the procuring activity, some other content specific layer Document Type Definition (DTD) must be specified and approved by the government. The IETMDB can be invoked by a procuring activity in either one of two modes as follows, depending on whether a data base is (1) specified for interchange and delivery to the Government, or (2) being developed and maintained for the subsequent preparation of IETMs, but not actually delivered to the Government.

3.1.1 <u>Data Base interchange requirements</u>. When specified, IETMDBs which are to be delivered to the Government under this specification shall be structured and tagged in accordance with the DTDs and the tag set descriptions included as Appendices A through D of this specification (see 6.2).

3.1.2 <u>Data base structuring and data element naming requirements</u>. Unless otherwise specified, a deliverable instance created under this specification shall be structured in accordance with the hierarchical relationships defined in the CDM DTDs contained in Appendices A and B, and created and named in accordance with the tag set descriptions contained in Appendices C and D (see 6.2). When a tagged instance is not specified for delivery, the contractor shall maintain the ability to map the internal element names to the specified content specific DTD names.

3.1.3 <u>Data maintainability</u>. The IETMDB shall be constructed with provisions to allow the incorporation of any change to automatically update all aspects of the data base affected by that change. This data-maintainability requirement shall involve changes to the IETMDB of the following two kinds:

    a.   Additions to, eliminations of, or changes to individual data elements and attributes;

    b.   Changes to relationships including establishment of new relationships or elimination of old relationships.

3.1.4 <u>Additional content specific DTDs</u>. When specified, additional content specific DTDs shall be used in addition to or instead of the content specific DTD defined in Appendices B and D of this specification (see 6.2). These DTDs shall be incorporated into the overall CDM in accordance with the requirements of 3.2.

3.2 <u>Generic layer</u>. The generic layer of the CDM is defined in the DTD listed in Appendix A. This DTD provides templates, which shall be used to define content specific elements. The generic layer includes a definition for each template and the attribute lists associated with the template. The DTD provides a definition of three other data types: primitive data elements that shall remain standard across all content specific applications; user interaction elements, called dialogs; and the context filtering elements, which shall be used to provide the most appropriate information to a user. The following paragraphs provide a description of the components of the generic layer.

3.2.1 <u>Templates</u>. Templates shall be used as described in Appendix A to define elements declared in content specific DTDs. The generic layer contains five templates: Node, Node Alternatives, Node Sequence, If Node, and Loop Node. Each template has two components: (1) a set of semantic rules that govern the template's activities, and (2) a list of attributes.

3.2.1.1 <u>Node template</u>. All elements conforming to the node template provide the capability for creating composite structures within the content specific layer. Composite structures contain primitives, links, and preconditions. When a composite structure contains other composite structures within its content model, this implies hierarchy. Elements employing the node template shall have a set of required attributes as follows.

3.2.1.1.1 <u>Name</u>. The "name" attribute of the element shall consist of the standard nomenclature for an instance of the element.

3.2.1.1.2 <u>Item-Id</u>. The "Item-Id" attribute shall specify the reference designator(s) and other identifiable designator(s) of the system(s), subassemblies, or part(s) referred to by the element.

3.2.1.1.3 <u>Type</u>. The "type" attribute shall specify the type of information contained in the element.

3.2.1.1.4 <u>CDM</u>. The "cdm" attribute shall identify the type of template being employed by the content specific element.

3.2.1.1.5 <u>Ref</u>. The "ref" attribute shall facilitate the reduction of data redundancy by allowing data elements to be referenced.

3.2.1.2 <u>Node Alternatives (Alts) template</u>. All elements conforming to the node alts template shall contain a list of mutually exclusive nodes, only one of which will be used at the time of presentation.
3.2.1.3 <u>Node Sequence (Seq) template</u>. All elements conforming to the node seq template group elements together as well as providing an order or presentation sequence to the elements. The elements conforming to the Node Seq shall also allow an author to define branching logic within the TI.

3.2.1.4 <u>If node template</u>. Elements conforming to the if node template provide a method for conditional branching. These elements shall use the same logic as the IF-THEN-ELSE statement in a programming language. The "IF" part is the expression in the content model. The "THEN" part is the first node seq, and is selected when the expression evaluates to true. The "ELSE" part is the second node seq, which is optional in the CDM, and is selected when the expression evaluates to not true.

3.2.1.5 <u>Loop node template</u>. The loop node template provides the equivalent of a loop in a programming language. This element shall provide the capability to create either a "FOR" loop or a "WHILE" loop within the data. The expressions and assertions developed in accordance with this template provide the testing criteria for the loop. The node sequence shall contain the actual elements to be repeated within the loop.

3.2.2 <u>Relational links</u>. Elements shall have relationships to other elements in TI, when applicable. These relationships shall be represented through two or more link ends. The link element shall provide the capability to show the relationship between several elements. The contractor shall include the specific cross references to elements within the IETMDB as well as information sources outside the IETMDB.

3.2.2.1 <u>Links to reduce redundancy</u>. Links shall be used to reduce the number of redundant elements by referencing common elements. The templates defined within the generic layer CDM DTD define

attributes to reduce redundant elements. These elements shall utilize the Standard Generalized Markup Language (SGML) #CONREF reference capability in accordance with International Standards Organization (ISO) 8879. A #CONREF attribute, used only in instances where an elements content model is EMPTY, shall contain the unique identifier of an element using a template or a location element.

3.2.2.2 <u>Location elements</u>. The location elements are defined by International Standards Organization/International Electrotechnical Commission (ISO/IEC) IS10744. Elements shall be referenced by other elements in accordance with ISO/IEC IS10744.

3.2.2.3 <u>Logistics support and task-analysis link</u>. The contractor shall establish linkages (information-access capabilities) with the IETMDB when external logistics support and task analysis systems developed in accordance with MIL-STD-1388-1 and MIL-STD-1388-2 exist.

3.2.3 <u>Primitive elements</u>. An IETMDB shall be composed of the primitive elements defined in the generic layer DTD as follows. Content and style for these elements shall be in conformance with the requirements of MIL-M-87268.

3.2.3.1 <u>Textual information</u>. Textual information shall consist of alphanumeric (i.e., character) data. Textual information shall also contain embedded references to some higher level elements such as those describing parts or consumables.

3.2.3.2 <u>Tables</u>. Tables shall be represented as a series of separate entries, each entry being associated with a specific row and column intersection (cell) of a table. Each entry in the table may be associated with other primitive types of information presentation and attributes. Each entry may refer (through a relationship) to any other template element or primitive element in the IETMDB.

3.2.3.3 <u>Graphics</u>. Graphics (drawings, illustrations) information shall be structured in a hierarchical manner and consist of logically related groups. Graphics shall be composed of a series of illustrations which can be overlaid on each other to build a complete graphic. These graphic "building blocks" are called graphic primitives. Graphic primitives may be combined to produce composite information which can be referenced and selected. Graphics shall be composed of information represented in accordance with the graphic standards included in MIL-STD-1840.

3.2.3.4 <u>Audio, video, and process</u>. The elements audio, video, and process provide the capability for the author to define an audio sequence, a video sequence, or a call to a software process.

3.2.3.5 <u>Dialogs</u>. Dialog elements are the basic element which provides the capability for user interaction with the TI. During a presentation these elements shall be used to prompt the user to input a response ("fillin"), select a choice from a set of alternatives ("menu"), or to select items from within a text, table or graphic ("selection").

3.2.4 <u>Context dependent filtering</u>. Context dependent filtering shall be accomplished through author-defined preconditions. A precondition shall contain an expression which will contain all the information necessary to identify what conditions must be present to display the TI.

3.2.4.1 <u>Preconditions</u>. A precondition shall contain an expression which identifies the conditions which must be present to display the TI. Precondition elements may be referenced by node elements. This implies that the element's information is relevant only if the precondition is true in the presentation situation.

3.2.4.2 <u>Postconditions</u>. Postconditions assert the value of an expression to a property. Once these property values are asserted, they shall be accessible to the presentation software for later testing and processing to determine the user's situation.

3.2.4.3 <u>Expressions</u>. Any expressions developed for an IETMDB shall conform to one of four types of expressions defined in the CDM. The first is a binary operation between two expressions; the second is a unary operation which is applied to an expression; the third and fourth are operations that identify an unique property (variable) or a value to be used in an expression.

3.3 <u>Content specific layer</u>. All TI shall be structured in accordance with a content specific DTD. One content specific DTD shall apply for an entire set of information regardless of the desired access to the information. The CDM will define the content and structure of the TI but will not describe format information.

3.3.1 <u>Control of content specific DTDs</u>. The contractor shall not exchange TI with the DoD unless it has been developed in accordance with the generic layer DTD and one or more of the latest versions of DoD approved content specific DTDs. If a content specific DTD does not exist which meets the contract's requirements, the contractor shall submit a content specific DTD to the Government for approval.

3.3.2 <u>Development of content specific DTDs</u>. If a new content specific DTD is developed, the contractor shall assure the content specific DTD meets the requirements of ISO 8879, and the requirements imposed by the generic layer DTD.

3.3.2.1 <u>Use of generic DTD primitive elements</u>. The generic layer of the CDM shall define a set of primitive elements. Those elements shall be available to any content specific layer DTD that includes the generic layer in an entity declaration. Any element defined within a content specific DTD which requires the use of any of the primitive elements need only include text, table, graphic, or dialog within its content model. The contractor shall not redefine the primitive elements within the content specific DTD. The elements using the primitive elements shall be restricted to the structure of the primitive elements as defined within the generic layer.

3.3.2.2 <u>Use of generic DTD template elements</u>. Elements within a content specific DTD shall conform to one of the templates defined within the generic layer. Elements shall include the attributes listed under the generic layer's definition of the templates. The two common attributes among the five templates are identification (id) and content data model (cdm). Each element employing a template includes an identification attribute for referencing. The cdm attribute identifies which template an element is employing.

3.3.3 <u>Content specific DTD for Organizational Level (O-Level) maintenance</u>. The following describes requirements for the content specific DTD included in this specification.

3.3.3.1 <u>Item/System hierarchy</u>. The vehicle, weapon system, or other equipment that is being maintained and operated is composed of several layers of subsystems, components, and parts. This hierarchical representation of the equipment being maintained and operated shall be accomplished by use of a system element that is used recursively, and which decomposes the equipment into only those components that are being maintained or operated. Each component of this hierarchy has associated with it one or more of the following four categories of information:

    a. Descriptive information

    b. Procedural information

    c. Troubleshooting information

    d. Parts information

3.3.3.2 <u>Descriptive information</u>. Descriptive information may provide information on system (subsystem, component, part) physical arrangement, functional behavior, theory of operation, and other aspects. Descriptive information shall contain a hierarchy of narrative paragraphs. Paragraphs, in turn, may refer to primitive elements.

3.3.3.3 <u>Procedural information</u>. Procedural information shall be composed primarily of task statements. Each task element shall be associated with attributes which provide related information such as: estimated completion time; maintenance level(s) where the task is to be performed; required conditions which must be met before performing the task; and the number of people required to perform the task. A procedural element may be linked to other elements which define the support equipment and consumables that task requires, through the establishment of appropriate relationships.

3.3.3.4 <u>Troubleshooting information</u>. Troubleshooting information shall contain data necessary to isolate faults found in a system. Troubleshooting information shall contain fault elements, fault state elements, test elements, outcome elements, and rectification elements.

3.3.3.4.1 <u>Fault elements</u>. Fault elements shall identify potential faults which might occur in the system.

3.3.3.4.2 <u>Fault state elements</u>. Fault state elements shall present a list of faults implicated as the result of a test that has been performed. Each suspected fault in the list shall be weighted, based on the probability that it is the cause of the observed malfunction. The fault state element may also present a list of possible faults that have been eliminated from consideration as the result of tests performed.

3.3.3.4.3 <u>Test elements</u>. Test elements shall contain a link to the procedural instructions a technician must follow to carry out a required task at a particular juncture in the troubleshooting procedure. Test elements shall also provide all possible test outcomes.

3.3.3.4.4 <u>Outcome elements</u>. Outcome elements shall contain definitions of new fault states associated with the results of a particular test. Outcome elements shall also contain a description of the state of the item being maintained. An outcome is based on one or more expressions (i.e., system states which

must be established for the specific outcome to apply). The final outcome element of a fault isolation procedure shall have a relationship which associates it with an identified fault. The identified fault has, in turn, associated with it the initial element of the appropriate corrective maintenance action.

3.3.3.4.5 <u>Rectification elements</u>. Rectification (i.e., corrective maintenance actions) elements shall contain references to procedural rectification tasks, checkout tests used to report the success of completed rectification tasks, and a list of all faults that the rectification shall repair.

3.3.3.5 <u>Parts information</u>. Two types of parts information shall be included: (1) maintainer/operator information, and (2) supply information. Elements containing either type shall refer explicitly to corresponding elements of the other type.

3.3.3.5.1 <u>Parts information for the maintainer or operator</u>. Parts information provided for a system maintainer and/or operator shall include such items as units per assembly, usable-on code, Mean Time Between Failures (MTBF), and reference designator, if applicable.

3.3.3.5.2 <u>Parts information provided for parts supply</u>. Parts information provided for the parts supply process shall constitute unambiguous identification of a part so that it can be reordered, and may consist of such items as: the part number; Commercial And Government Entity (CAGE) code; Source, Maintenance, and Recoverability (SMR) code; Hardness Critical Item (HCI) identification; and National Stock Number (NSN), if applicable.

4. QUALITY ASSURANCE PROVISIONS.

4.1 <u>Responsibility for inspection</u>. The contractor is responsible for the performance of all inspection requirements (examinations and tests) as specified herein. Quality Assurance (QA) for the IETMDB preparation shall be in accordance with the requirements of MIL-Q-87270. Except as otherwise specified in the contract or purchase order, the contractor may use his own or any other facilities suitable for the performance of the inspection requirements specified herein, unless disapproved by the Government. The Government reserves the right to perform any of the inspections set forth in this specification where such inspections are deemed necessary to ensure supplies and services conform to prescribed requirements.

4.1.1 <u>Responsibility for compliance</u>. All items shall meet all requirements of sections 3 and 5 of this specification. The inspection set forth in this specification shall become a part of the contractor's overall inspection system or quality program. The absence of any inspection requirements in this specification shall not relieve the contractor of the responsibility of ensuring that all products or supplies submitted to the Government for acceptance comply with all requirements of the contract. Use of sampling for inspections shall be in accordance with MIL-Q-87270; however, Government approval for use of sampling in QA procedures does not authorize submission of known defective material, either indicated or actual, nor does it commit the Government to accept defective material.

5. PACKAGING.

5.1 <u>Preparation for delivery</u>. Items shall be packaged in the most economical manner that will provide adequate protection during shipment in accordance with accepted industrial packaging procedures.

5.1.1 Digital product packaging. Packaging of encoded computer products, in preparation for delivery, shall be in accordance with the requirements of MIL-STD-1840.

5.1.2 Classified material. Classified material shall be packaged and identified in accordance with DOD 5200.1-R and DOD 5220.22-M.

6. NOTES.
(This section contains information of a general or explanatory nature that may be helpful, but is not mandatory.)

6.1 Intended use. An IETMDB is the source data for the preparation of IETMs. IETMs prepared in accordance with this specification are intended for use in the installation, operation, maintenance, repair, and logistics support of equipment/systems or for the accomplishment of the assigned mission of users.

6.2 Acquisition requirements. Acquisition documents must specify the following:

a. Title, number and date of the specification.

b. Issue of the DODISS to be cited in the solicitation, and if required, the specific issue of individual documents referenced (see 2.1.1, 2.1.2).

c. If IETM program elements shall be other than as specified herein (3.1).

d. If the specification applies to the delivery and tagging of an IETMDB (3.1.1).

e. If the specification applies to the structuring of the IETMDB and naming of the IETMDB elements which are created and maintained by the contractor (3.1.2).

f. Content specific DTDs other than the one included herein and whether these are to be used in addition to or instead of the content specific DTD included herein, if additional DTDs apply (3.1.4).

6.3 Data requirements. Any applicable Data Item Descriptions (DIDs) must be listed on the Contract Data Requirements List (CDRL) when this specification is applied on a contract, in order to obtain the data, except where DOD FAR Supplement 27.475-1 exempts the requirement for a DD Form 1423. DID citations shall be as follows:

Reference Paragraph	DID Number	DID Title	Suggested Tailoring
	(None Required)		

6.4 <u>Definitions of acronyms and terms</u>. Acronyms and IETM terms not listed in MIL-STD-12 are included in the definitions contained in 6.4.1 through 6.4.3.

6.4.1 <u>Acronyms</u>.

ALHRD	Armstrong Laboratory Human Resource Division
AFMC	Air Force Materiel Command
AMSC	Acquisition Management System Control (number)
ANSI	American National Standards Institute
ATE	Automatic Test Equipment

SMR	Source, Maintenance, and Recoverability (Code)
STD	Standard
TI	Technical Information

TMSS	Technical Manual Specifications and Standards (standardization program)
WL	Water Line
WS	Wing Station

6.4.2 <u>Interactive Electronic Technical Manual (IETM)</u>. A technical manual, prepared (authored) by a contractor and delivered to the Government, or prepared by a Government activity, in digital form on a suitable medium, by means of an automated authoring system; designed for electronic screen display to an end user, and possessing the following three characteristics:

a. The format and style of the presented information are optimized for screen presentation to assure maximum comprehension; that is, the presentation format is "information oriented", not "page oriented".

b. The elements of technical data constituting the IETM are so interrelated that a user's access to the information required is facilitated to the greatest extent possible, and is achievable by a variety of paths.

c. The computer controlled IETM display device can function interactively (as a result of user requests and information input) in providing procedural guidance, navigational directions, and supplemental information; and also in providing assistance in carrying out logistic support functions supplemental to maintenance.

6.4.3 <u>Quality assurance</u>. A planned and systematic series of procedures carried out by the contractor as monitored by the Government, necessary to ensure a high degree of confidence that deliverable technical data conforms to contract requirements. The culminating action in a Quality Assurance Program (QAP) is contractor support of the Government verification procedure.

6.5 <u>Subject terms (key word) list</u>.

GENERIC LAYER
DOCUMENT TYPE DEFINITION (DTD)

10. SCOPE.

10.1 <u>Scope</u>. The DTD within this appendix provides the structure and content of documents prepared in accordance with this specification. Unless otherwise specified by the procuring activity, this Appendix is a mandatory part of this specification. The information contained herein is intended for compliance.

20. APPLICABLE DOCUMENTS.

20.1 <u>Government documents.</u>

20.2 <u>Non-Government publications.</u> The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of the documents which are DoD adopted are those listed in the issue of the DODISS cited in the solicitation. Unless otherwise specified, the issues of documents not listed in the DODISS are the issues of the documents cited in the solicitation.

    ISO 8879   Information Processing - Text and Office Systems - Standard Generalized Markup Language (SGML)

    ISO/IEC IS10744 Information Technology - Hypermedia/Time-based Document Structuring Language (HyTime)

(Application for copies should be addressed to the American National Standards Institute, 1430 Broadway, New York, NY 10018.)

30. GENERIC LAYER DOCUMENT TYPE DEFINITION.

30.1 <u>Use of SGML</u>. The markup tags described herein are based on rules outlined in ISO 8879. All data to be delivered digitally in accordance with this specification shall be tagged using the DTD in this section and associated content specific DTD(s).

30.2 <u>Template document type</u>. The DTD for this specification is as follows:

```
<!-- ***************************************************

        IETM CONTENT DATA MODEL     Version 6.1
        Generic Layer               1 October 1992
```

****

The IETM CDM provides a representation of technical information elements and their relationships. The CDM is composed of two separate layers. The first is the "Generic Layer". It defines general characteristics which are common across all applications. The second layer is the "Content Specific Layer," which contains content specific DTDs.

The generic layer defines the templates, linking elements, primitive elements, and context filtering elements which are used to create content specific DTDs. Templates define rules which must be followed in the creation of content specific DTD's and document instances. The templates provide the structure for creating composite nodes, context dependent filtering, user interaction and branching. The templates provide basic sets of rules to which elements must adhere. Those rules are explained after the declaration of each template in this document.

The CDM linking elements are taken from the HyTime Model. These elements provide the capability to link between CDM elements, other SGML files, and non SGML documents. These capabilities are explained in the HyTime Linking Mechanism section of this document.

The primitive elements ("text", "table", "graphic", "audio", "video","process", and "dialog") are defined in the generic layer. These elements may be used to construct a variety of composite elements in the content specific layer. The primitive elements' structures shall remain constant.

Context dependent filtering provides the capability to present the user with only the information that applies to a specific situation. The precondition and postcondition elements provide the mechanism for context dependent filtering. The precondition element enables the selection of the appropriate information for presentation. The postcondition element enables the recording of presentation events for later filtering.

`<!-- ****************************************************`

TEMPLATES

`****************************************************`

The following section defines the generic layer templates. These templates define semantic rules for creating content specific elements. These semantic rules make up the minimum set of constraints on content specific elements.

There are two general rules to follow when creating a content specific element. First, the element's content model must comply with the template's content model. Second, the template's attribute entity must be included in the element's attribute list. The attribute entities for all templates include the attributes "id", "cdm", "ref". The "cdm" attribute indicates which template the element is employing. The "id" and "ref" attributes are used for non-redundant referencing and linking.

The "ref" attribute utilizes the SGML #CONREF capability. A #CONREF attribute is only filled in when the element's content model is empty. In this case, the #CONREF attribute contains a reference which is a unique identifier to either an element of the appropriate type or a location element that resolves to an element of the appropriate type (see section on Hytime linking mechanism). When an element uses the #CONREF capability, the referencer's attribute list will take precedence over the referenced element's attributes.

This section includes an element declaration for each template (NODE, NODE ALTS, NODE SEQ, IF NODE, LOOP NODE). The declarations are enclosed within comments, and are not formally a part of the DTD. These element declarations use template names, in all caps, to describe content model constraints for each template. When creating content specific elements, these template names must be replaced by element names of the appropriate type. -->

<!-- ***** NODE TEMPLATE ***** -->

<!-- The NODE contains the content of the technical information. The NODE element creates hierarchy within the CDM. NODE also contains context filtering preconditions and postconditions. The link element within the NODE provides the capability to cross reference other technical information. The use of link, from the Hytime model, provides additional functionality by allowing a link to be made to a document outside the CDM specification boundary.

The NODE template provides the capability to create composite
structures within the content specific layer. Composite
structures may contain subcomponents that employ the NODE, NODE
ALTS, or NODE SEQ templates. The NODE subcomponents may be
composite structures themselves or they may be primitive NODES
(text, tables, graphics, audio, video, process, and dialog).
Composite structures create hierarchy within the CDM. When
composite nodes contain other composite nodes there is an implied
hierarchy. The composite node in the content model is at a lower
level in the hierarchy (e.g. a Task Node contains Step Nodes in
its content model).

    The following defines the NODE template:

```
<!ELEMENT "NODE"  - -  ( precond*, link*, ( NODE | NODE-ALTS |
                    NODE-SEQ | %primitive; )*, postcond* )>

-->

<!ENTITY % a.node
                "id        ID          #IMPLIED
                 name      CDATA       #IMPLIED
                 type      CDATA       #IMPLIED
                 itemid    CDATA       #IMPLIED
                 cdm       NAME        #FIXED      'node'
                 ref       IDREF       #CONREF" >
```

<!-- The following semantic rules apply to any content specific
element employing the NODE template: (1) The element may contain
a list of preconditions that identify the element's
applicability. The list of preconditions will be evaluated at
presentation time, and if all preconditions evaluate to true,
that node will be presented. (2) The element may contain
relational links to other data items. (3) The element may
contain subcomponents that employ the NODE, NODE ALTS, or NODE
SEQ templates. (4) The element may contain a list of
postconditions which record presentation events. The
postconditions will be evaluated after the NODE and all its
subcomponents have been presented. The postcondition values will
then be assigned to their specified properties. -->

        <!-- ***** NODE ALTS TEMPLATE ***** -->

<!-- NODE ALTS (node alternatives) will contain a list of
mutually exclusive nodes. Their grouping is due to the fact that
they apply in different contextual situations. In this manner,
the NODE-ALTS element is a logical reference that contains a set
of NODES which might apply to different situations. An important
fact in the NODE-ALTS structure is that no hierarchy is implied
between the generic identifier and the content model NODES (e.g.
a Task-alts element will contain Task-nodes in its content
model).

The following defines the NODE ALTS template:

<!ELEMENT "NODE-ALTS"   - -   (NODE)+ >

-->

<!ENTITY % a.node-alts
          "id   ID   #IMPLIED
           cdm   NAME   #FIXED   'node-alts'
           ref   IDREF   #CONREF"   >

<!-- The following semantic rules apply to any content specific
element employing the NODE ALTS template. (1) The element must
contain components that employ the NODE template. (2) The
components must be of the same element type and at the same level
in the hierarchy. (3) At presentation time, the precondition
for each NODE alternative will be evaluated. The NODE whose
precondition evaluates to "true" will be selected for
presentation. (4) These components must contain mutually
exclusive preconditions. In any specific situation, at most one
node would have a precondition which evaluates to true. (5) There
need not be an applicable component for every possible situation.
-->
          <!-- ***** NODE SEQ TEMPLATE ***** -->

<!-- The NODE SEQ template is the mechanism for creating
interactive sequences with the user.

The following defines the NODE SEQ template:

<!ELEMENT "NODE-SEQ"   - -   (NODE | NODE-ALTS | IF-NODE |
                                LOOP-NODE)+ >

-->

```
<!ENTITY % a.node-seq
        "id         ID          #IMPLIED
         cdm        NAME        #FIXED      'node-seq'
         ref        IDREF       #CONREF"                    >
```

<!-- The following semantic rules apply to the NODE SEQ template. (1) Any content specific element employing NODE-SEQ must contain components that employ the NODE, NODE ALTS, IF NODE, or LOOP NODE templates. (2) The components of a NODE SEQ are always traversed in the order they appear. This traversal includes the branching and iteration implicit in any IF NODES or LOOP NODES in the sequence logic. -->

<!-- ***** IF NODE TEMPLATE ***** -->

<!-- The IF NODE template uses the same logic as the IF-THEN-ELSE statement in a programming language. The "IF" part is the expression in the content model. The "THEN" part is the first NODE SEQ; the "ELSE" part is the second NODE SEQ, which is optional.

     The following defines the IF NODE template:

```
<!ELEMENT "IF-NODE"   - -     ( expression, NODE-SEQ, NODE-SEQ? )
>
```

-->

```
<!ENTITY % a.if-node
        "id         ID          #IMPLIED
         cdm        NAME        #FIXED      'if-node'
         ref        IDREF       #CONREF"                    >
```

<!-- The following semantic rules apply to the IF NODE template. (1) The expression will be evaluated at presentation time; (2) If the expression evaluates to "true" the first NODE SEQ will be traversed; (3) If the expression evaluates to anything but "true", and the second NODE SEQ is present, the second NODE SEQ is traversed. (4) If the expression evaluates to anything but "true", and the second NODE SEQ is not present, the next element in the sequence will be presented. -->

<!-- ***** LOOP NODE TEMPLATE ***** -->

<!-- The LOOP NODE template provides the capability similar to
that found in a programming language for creating loops. The
template provides the syntax for creating WHILE or FOR NEXT
loops, whichever applies to the situation. For example, when
creating a FOR NEXT loop, the first assertion initializes the
control variable for the loop. The expression is the test
criterium for exiting the loop. The second assertion alters the
control variable at the end of each loop iteration. The node
sequence provides the actual element(s) to be repeated within the
loop.

     The following defines the LOOP NODE template:

<!ELEMENT "LOOP-NODE"   - -   (assertion?, expression,
                                  assertion?, NODE-SEQ) >

-->

<!ENTITY % a.loop-node
         "id   ID   #IMPLIED
          cdm   NAME   #FIXED   'loop-node'
          ref   IDREF   #CONREF"   >

<!-- The following semantic rules apply to the LOOP NODE
template, when employing it as in a FOR NEXT loop. (1) At the
beginning of the loop the first assertion is evaluated and the
value is assigned to the specified property. (2) The expression
is evaluated and if the expression evaluates to anything but
"true" the loop is terminated. (3) If the expression evaluates
to true, the NODE SEQ is traversed. (4) At the end of each
iteration, the second assertion is evaluated and the value is
assigned to the specified property. (5) Steps 2-4 are continued
until the loop terminates.

   The semantic rules which apply to the LOOP NODE template, when
employing it as in a WHILE loop, are as follows. (1) The
expression is evaluated and if the expression evaluates to
anything but "true" the loop is terminated. (2) If the
expression evaluates to true, the NODE SEQ is traversed. (3)
Steps 1-2 are continued until the loop terminates.

     ****

                   HYTIME LINKING MECHANISM

```
    ****************************************************
```

    This section defines the linking mechanism which is based on
the HyTime standard. -->

```
<!ELEMENT link     - -     ( #PCDATA )  >
<!ATTLIST link
         id             ID             #IMPLIED
         Hytime         NAME           #FIXED   'ilink'
         endtypes       CDATA          #FIXED   'desc parts text
                                                 table graphic
                                                 audio video
                                                 process'

         linkends       IDREFS         #REQUIRED
         desc           IDREFS         #IMPLIED
         parts          IDREFS         #IMPLIED
         text           IDREFS         #IMPLIED
         table          IDREFS         #IMPLIED
         graphic        IDREFS         #IMPLIED
         audio          IDREFS         #IMPLIED
         video          IDREFS         #IMPLIED
         process        IDREFS         #IMPLIED >
```

<!-- The "link" element provides the capability for creating
relational links within the CDM. "Link" is included within the
content model of the NODE template, therefore, any content
specific element employing the NODE template may include
relational links. The 'HyTime' attribute indicates that "link"
employs the "ilink" architectural form (template) from the HyTime
model.

   The endtypes define the allowable "anchors" to which a node
may point. The initial endtypes defined are links to descriptive
information, parts information or any primitive. There are no
limits to the type of linkends, and others may be added in the
future.

```
    ****************************************************
```

                     PRIMITIVE ELEMENT DECLARATIONS

```
    ****************************************************
```

The following element declarations define the primitive data
elements used throughout the technical information. Each element
is defined in terms which can be employed in any content specific
DTD.   -->

```
                    <!-- *****  TEXT  ***** -->

<!ELEMENT text        - -       ( precond*, link*, ( #PCDATA  |
                                  text-alts | text | %mathtxt;
                                  | %mathcon; )+ ) >
<!ATTLIST text
          %a.node; >
```

<!-- A "text" unit is basically a text string of "parsable
character data" or PCDATA. Within a text string, there may be
embedded "text" elements which allow the referencing of other
elements or parts of elements through the link/location mechanism
explained in the HyTime section of this document. Those embedded
"text" references are inserted in the text string that contained
them. For example, the string may contain a reference to a
standard system name, a standard part nomenclature or a standard
task name. By using this mechanism, standard terminology can be
referenced consistently throughout the data base, and any changes
to the standard terminology can be made in one location and
automatically updated throughout the data base. -->

```
<!ELEMENT text-alts     - -     ( text )+ >
<!ATTLIST text-alts
          %a.node-alts;                       >
```

<!-- This element provides the ability to have context sensitive
filtering of text. -->

```
                    <!-- *****  TABLE  ***** -->

<!ELEMENT table        - -       ( precond*, link*, rowhddef*,
                                   ( colhddef?, entry+ )+ ) >
<!ATTLIST table
          %a.node;                            >
```

```
<!--  This element defines how a table is constructed.  A "table"
will contain a list of the row headers.  Each column header will
be followed by one or more entries.  The combination of column
header and entries may be repeated for as many columns as the
"table" requires.  -->

<!ELEMENT table-alts     - -         ( table )+ >
<!ATTLIST table-alts
         %a.node-alts;                         >

<!--  This element provides the ability to have context sensitive
filtering of "tables".  -->

<!ELEMENT rowhddef     - -         ( %text; ) >
<!ATTLIST rowhddef
         id                ID         #IMPLIED
         ref               IDREF      #CONREF
         row               NUTOKEN    #REQUIRED >

<!--  This element defines a row header to be a piece of text and
a row number.  However, if a row header has been previously
defined, the 'ref' attribute allows the referencing of that
element from another table.  The 'row' for the element that
references a previously defined header takes precedence over the
original 'row' in the referenced header.  -->

<!ELEMENT colhddef     - -         ( %text; ) >
<!ATTLIST colhddef
         id                ID         #IMPLIED
         ref               IDREF      #CONREF
         colnum            NUTOKEN    #REQUIRED >

<!--  This element defines a column header to be a piece of text
and a column number.  However, if a column header has been
previously defined, the 'ref' attribute allows the referencing of
that element from another table.  The 'colnum' for the element
that references a previously defined header takes precedence over
the original 'colnum' in the referenced header.  -->

<!ELEMENT entry        - -         ( %text; | %graphic; ) >
<!ATTLIST entry
         id                ID         #IMPLIED
         ref               IDREF      #CONREF
         colnum            NUTOKEN    #REQUIRED
```

```
       row                    NUTOKEN    #REQUIRED >
```

<!-- This element defines an entry for a cell in a table to be a
piece of text and the appropriate row and column. The row and
column define the cell to place the entry. However, if an entry
has been previously defined, the 'ref' attribute allows the
referencing of that element from another table. The 'colnum' and
'row' for the element that references a previously defined entry
take precedence over the original 'colnum' and 'row'. -->

<!-- ***** GRAPHICS ***** -->

<!-- The CDM allows the referencing of "graphics" in external
representations or embedded within the CDM. Graphics are an
integral part of technical information. Therefore, all possible
standard representations have been included within the following
primitive elements. -->

```
<!ELEMENT graphic     - -      ( precond*, link*, ( %graphic;)+ ) >
<!ATTLIST graphic
      %a.node;
      minsize           NUTOKENS              #IMPLIED
      penshape          CDATA                 #IMPLIED
      penpatt           CDATA                 #IMPLIED
      transfrm          NUTOKENS              #IMPLIED
      window            NUTOKENS              #IMPLIED >
```

<!-- This element describes graphics in terms of primitives or
references to other graphics, thus providing the ability to
create composite graphics. -->

```
<!ELEMENT graphic-alts    - -       ( graphic )+ >
<!ATTLIST graphic-alts
          %a.node-alts;                         >
```

<!-- This element provides the ability to have context sensitive
filtering of graphics. -->

```
<!ELEMENT grphprim      - -    ( precond*, link*, (%text;) ) >
<!ATTLIST grphprim
      %a.node;
      coding  (cgmchar | cgmbin | cgmclear |
```

```
              fax      | iges   | dxf        |
              gks)                             'cgmbin'
      minsize          NUTOKENS           #IMPLIED
      penpatt          CDATA              #IMPLIED
      penshape         CDATA              #IMPLIED
      transfrm         NUTOKENS           #IMPLIED

<!--  This element defines a primitive graphic which may be
contained in the content model or referenced by the 'ref'
attribute.  The graphic is represented in one of the valid
formats (cgmbin, cdmchar, cgmclear, fax, iges, dxf, gks), and the
format is indicated by the coding attribute.  The 'type'
attribute may identify a graphic as a "hotspot", thus making it
selectable during presentation.  The minsize attribute specifies
the minimum height requirements for display of the graphic.  Any
transformations or manipulations of the graphic, other than those
described by the notations, can be defined using the penpatt,
penshape, transfrm, or window attributes on the graphic primitive
element.  -->

<!-- This element provides the capability of creating a special
"dialog" that allows selection within a given picture, text
string or table.  The semantics require a 'link' for each
selectable item within the text, table, or graphic selection.
Each 'link' must have at least one linkend specifying the
selectable element in the text, table, or graphic.  Each link
will be paired with an assertion or dialog specifying the action
to be taken if that item is selected.   -->
```

<!--**

                CONTEXT FILTERING ELEMENT DECLARATIONS

     ** -->

        Context dependent filtering provides the capability to
present the user with only the information that applies to his
specific situation. The precondition and postcondition elements
provide the mechanism for context dependent filtering. The
precondition element enables the selection of the appropriate
information for presentation. The postcondition element enables
the recording of presentation events for later filtering.

        This mechanism assumes that a state table is maintained at
presentation time to represent the current situation.   The
current situation or state is defined by a set of property value
pairs. A property value pair associates a value to a property
name. It provides the capability to obtain a value by looking up
a property name in the state table. -->

property is undefined. Property's of any type can take on the
"nil" value. -->

<!-- **

                 Semantics of expression operations

          ** -->

Listed below are the value-types allowed in the generic layer and
the valid operators under each value-type, and the semantics of
each operation including the return value-type.

OPERATIONS WHICH APPLY TO MULTIPLE DATATYPES:

Operation: <eq|ne>
Form: <value><eq|ne><value>
Return Value: <boolean>
Meaning: If both operands are the same value-type (or both
                 are numbers) then the return value is dependent
                 upon what eq|ne means for that value-type. If the
                 operands are of different types, the return value

 is 'False'.

```
Operation:      <size>
Form:           <size><string>
                <size><sequence>
                <size><set>
Return Value:   <boolean>
Meaning:            An integer value which is the length of the
                    <string> or the number of values in the
                    <set|sequence>. For <set|sequence> this
                    number represents the members of the
                    <set|sequence>. It does not count the
                    elements which are members of an included
                    <set|sequence>.

Operation:      <empty>
From:           <empty><string>
                <empty><set>
                <empty><sequence>
Return Value:   <boolean>
Meaning:            True if the string, set, or sequence is
                    empty.  False otherwise. Logically
                    equivalent to size(<..>) = 0.

Operation:      <index>
Form:           <index><string>
                <index><sequence>
Return Value:   <string> | <sequence>
Meaning:            The index operator can have one or two
                    index-values in its SGML content. An
                    index-value  is a signed integer value. Its
                     meaning is dependent upon its sign. A
                    positive value means an index position
                    counted from the beginning of the
                    <string|sequence>.  A negative number means
                    an index position counted back from the end
                    of the <string|sequence>.  A zero means the
                    end of the string.

Operation:      <add>
Form:           <set><add><value>
                <sequence><add><value>
Return Value:   <set> | <sequence>
```

Meaning: For a set, add simply means make a new set which
                has all the members of the old set plus <value>.
                For a sequence the add operator shall have an
                index-value as described above for the index
                operation. The <value> will be inserted
                before the position pointed to by the
                index position. If no index-value is given the
                <value> is added at the end of the sequence.

Operation: <remove>
Form: <set><remove><value>
                <sequence><remove><value>
                <remove><sequence>
                <remove><string>
Return Value: <set> | <sequence> | <string>
Meaning: For a <set> remove returns a <set> with <value>
                removed. For a <sequence> using the binary
                operand form it returns a <sequence> which has
                the first instance of <value> removed. For a
                <sequence> or <string> as a unary operator remove
                must contain an index-value which refers to the
                position from which the character in the <string>
                is to be removed or the value in the <sequence>
                is to be removed. The new string or sequence will
                be the old one up to but not including the index
                position concatenating with the old one after the
                index position.

Operation: <member>
Form: <value><member><set>
                <value><member><sequence>
Return Value: <boolean>
Meaning: True if <set|sequence> contains an member who is
                equal to <value>. False otherwise. This is not a
                    recursive search on any <set|sequence> that
                    might be part of the <set|sequence>.

BOOLEAN OPERATIONS:

Operation: <or>
Form: <boolean><or><boolean>
Return Value: <boolean>
Meaning: The boolean or function.

```
Operation:        <and>
Form:             <boolean><and><boolean>
Return Value:     <boolean>
Meaning:          The boolean and function.

Operation:        <xor>
Form:             <boolean><xor><boolean>
Return Value:     <boolean>
Meaning:          The boolean xor function.

Operation:        <not>
Form:             <not><boolean>
Return Value:     <boolean>
Meaning:          The boolean not function.

STRING OPERATIONS:

Operation:        <concat>
Form:             <string><concat><string>
Return Value:     <string>
Meaning:          The return value is a new string which is equal to
                  the first string with the second string
                  concatenated to the end of it.

Operation:        <empty>
Form:             <empty><string>
Return Value:     <boolean>
Meaning:          True if the string is empty ( size = 0 ). False
                  otherwise.  This is equivalent to size
                  ( <string> = 0 ).

Operation:        <substring>
Form:             <string><substring><string>
Return Value:     <boolean>
Meaning:          True if the first string is a substring of the
                  second string. False otherwise.

SEQUENCE OPERATIONS

Operation:        <append>
Form:             <sequence><append><sequence>
Return Value:     <sequence>
```

```
Meaning:              A new sequence equal to the first sequence
                      with the second sequence appended to the
                      end.

Operation:     <subsequence>
Form:          <sequence><subsequence><sequence>
Return Value:  <boolean>
Meaning:              True if the first sequence is a subsequence
                      of the second.   False otherwise.

Operation:     <head>
Form:          <head><sequence>
Return Value:  <value>
Meaning:              Returns the first element in sequence.

Operation:     <tail>
Form:          <tail><sequence>
Return Value:  <sequence>
Meaning:       Returns a sequence with the first element
               removed.

SET OPERATIONS

Operation:     <union>
Form:          <set><union><set>
Return Value:  <set>
Meaning:       A new set which is the union of the two sets.

Operation:     <intersect>
Form:          <set><intersect><set>
Return Value:  <set>
Meaning:       A new set which is the intersection of the two
               sets.

Operation:     <set-diff>
Form:          <set><set-diff><set>
Return Value:  <set>
Meaning:       A new set which is the difference of the two
               sets.

Operation:     <disjoint>
Form:          <set><disjoint><set>
Return Value:  <boolean>
```

```
Meaning:        True if the intersection of the two sets is
                empty.  False otherwise. This is equivalent to
                empty( <set1> intersect <set2>).

Operation:      <subset>
Form:           <set><subset><set>
Return Value:   <boolean>
Meaning:        True if the first set is a subset of the second.
                False otherwise.

NUMBER OPERATIONS

Operation:      <gt>
Form:           <integer><gt><integer>
                <integer><gt><real>
                <real><gt><integer>
                <real><gt><real>
Return Value:   <boolean>
Meaning:        True if the first number is greater than the
                second.  False otherwise.

Operation:      <ge>
Form:           <integer><ge><integer>
                <integer><ge><real>
                <real><ge><integer>
                <real><ge><real>
Return Value:   <boolean>
Meaning:        True if the first number is greater than  or
                equal to the second. False otherwise.

Operation:      <lt>
Form:           <integer><lt><integer>
                <integer><lt><real>
                <real><lt><integer>
                <real><lt><real>
Return Value:   <boolean>
Meaning:        True if the first number is less than the second.
                False otherwise.

Operation:      <le>
Form:           <integer><le><integer>
                <integer><le><real>
                <real><le><integer>
```

```
                      <real><le><real>
Return Value:         <boolean>
Meaning:              True if the first number is less than  or equal
                      to the second. False otherwise.

Operation:            <plus>
Form:                 <integer><plus><integer>
                      <integer><plus><real>
                      <real><plus><integer>
                      <real><plus><real>
Return Value:         <integer> | <real>
Meaning:              Return the value of the first number plus the
                      second number. The return value is a real unless
                      both numbers are integers.

Operation:            <minus>
Form:                 <integer><minus><integer>
                      <integer><minus><real>
                      <real><minus><integer>
                      <real><minus><real>
Return Value:         <integer> | <real>
Meaning:              Return the value of the first number minus the
                      second number. The return value is a real unless
                             both numbers are integers.

Operation:            <times>
Form:                 <integer><times><integer>
                      <integer><times><real>
                      <real><times><integer>
                      <real><times><real>
Return Value:         <integer> | <real>
Meaning:              Return the value of the first number times the
                      second number. The return value is a real unless
                      both numbers are integers.

Operation:            <divide>
Form:                 <integer><divide><integer>
                      <integer><divide><real>
                      <real><divide><integer>
                      <real><divide><real>
Return Value:         <real>
Meaning:              Return the value of the first number divided by
                      the second number. The return value is a real.
```

```
Operation:      <idivide>
Form:           <integer><idivide><integer>
                <integer><idivide><real>
                <real><idivide><integer>
                <real><idivide><real>
Return Value:   <integer>
Meaning:        Return the value of the first number divided by
                the second number. The return value is truncated
                to an integer.

Operation:      <exponent>
Form:           <integer><exponent><integer>
                <integer><exponent><real>
                <real><exponent><integer>
                <real><exponent><real>
Return Value:   <integer> | <real>
Meaning:        Return the value of the first number raised to
                the power of the second number. The value is a
                real unless the first number is an integer and
                the second number is a positive integer.

Operation:      <mod>
Form:           <integer><mod><integer>
Return Value:   <integer>
Meaning:        The return value is equal to the integer
                remainder after the first number is
                integer-divided by the second. ( This is the
                standard definition of the mod operator ).

Operation:      <neg>
Form:           <neg><integer>
                <neg><real>
Return Value:   <integer> | <real>
Meaning:        The return value is the negative of the number.
                It is an integer if the number is an integer, and
                real if the number is a real.

Operation:      <trunc>
Form:           <trunc><integer>
                <trunc><real>
Return Value:   <integer>
Meaning:            The return value is the number truncated to
                    be an integer.
```

```
Operation:      <float>
Form:           <float><integer>
                <float><real>
Return Value:   <real>
Meaning:            The return value is the number converted to
                    a real number value.

-->
```

A CONTENT SPECIFIC
DOCUMENT TYPE DEFINITION (DTD)

10.   SCOPE.

10.1   <u>Scope</u>. The DTD within this appendix provides the
structure and content of documents prepared in accordance with
this specification. Unless otherwise specified by the procuring
activity, this Appendix is a mandatory part of this
specification. The information contained herein is intended for
compliance.

20.   APPLICABLE DOCUMENTS.

20.1   <u>Government documents.</u>

20.2   <u>Non-Government publications.</u>   The following documents
form a part of this document to the extent specified herein.
Unless otherwise specified, the issues of the documents which are
DoD adopted are those listed in the issue of the DODISS cited in
the solicitation. Unless otherwise specified, the issues of
documents not listed in the DODISS are the issues of the
documents cited in the solicitation.

    ISO 8879   Information Processing - Text and Office
                      Systems -Standard Generalized Markup Language
                      (SGML)

    ISO/IEC IS10744   Information Technology - Hypermedia/Time-based
                      Document Structuring Language (Hytime)

(Application for copies should be addressed to the American
National Standards Institute, 1430 Broadway, New York, NY
10018.)

30.   A CONTENT SPECIFIC DOCUMENT TYPE DEFINITION.

30.1   <u>Use of SGML</u>. The markup tags described herein are based
on the rules outlined in ISO 8879. All data to be delivered
digitally in accordance with this specification shall be tagged
using the DTD in this section and the generic DTD found in
Appendix A.

30.2   Template document type . The DTD for this specification is
as follows:

<!DOCTYPE techinfo [

<!-- **

        IETM CONTENT DATA MODEL   Version 6.1
        Content Specific DTD   1 October 1992

        ** -->

<!-- This document contains a content specific DTD for O-level
maintenance. The creation of a content specific DTD represents
the second layer of the CDM. It identifies all the content
specific elements and their relationships for a given
application. In this instance, the application happens to be the
display of organizational level data to the technician.

        The DTD employs the characteristics defined by the
templates of the "Generic Layer."   The use of the generic layer
primitives means that we do not have to redefine the text, table,
graphic, audio, video, or process elements within this document.

        This document breaks down O-level data into a hierarchy
based upon the system/subsystem structure of the weapon system.
It identifies four different types of information which may be
referenced within the document. They are; procedural,
descriptive, parts, and fault information. Each type of
information is referenced by the system where it is most
appropriate.

                Fault Declaration

        ** -->

<!-- The "fault" element identifies the cause of a discrepancy
on the weapon system. The fault will identify the appropriate
rectification to correct the discrepancy. When transitioning
between maintenance levels the fltstate element is used. -->

```
<!ELEMENT fault   - - ( precond*, link*, ( %rect; | %fltstate;
)+,                    (%system;)+ ) >
<!ATTLIST fault
         %a.node;
         version
   IDREF
   #REQUIRED
         status
   ( u | a )
   'a'
         mtbf
                  CDATA
                  #IMPLIED  >
```

<!-- The fault element employs the 'NODE' template. It contains
a list of preconditions, and relational links to other
appropriate information. The rectifications contain tasks which
will correct the discrepancy. The system and part information

elements will create a back link to the part that has failed.
The "fltstate" represents the system at the next level of
maintenance. -->

```
<!ELEMENT fault-alts   - -    ( fault )+  >
<!ATTLIST fault-alts
         %a.node-alts;  >
```

<!-- This element employs the 'NODE ALTS' template from the
generic layer to facilitate the context filtering of faults. -->

<!-- **

                  Rectification Declaration

      ** -->

<!-- The "rect" element identifies the prescribed task that will
repair the fault causing the discrepancy and all other faults
that could be fixed by the rectification. Upon completion of the
task, a test is performed to verify the effect of the
rectification.
-->

```
<!ELEMENT rect    - -  ( precond*, link*, (%task;)+, (%fault;)+,
                        (%system;),  (%test;)* ) >
<!ATTLIST rect
         %a.node;
         version
  IDREF                #REQUIRED
         status
  ( u | a )            'a'
         action
  ( swap | maint )     "swap"
         agent
  CDATA                "human"  >
```

<!-- The rect element employs the 'NODE' template. It contains
a list of preconditions, and relational links to other
appropriate information. The "system" element provides a
reference to the system which will be repaired by the
rectification. The test element identifies all check-out tests
required before completing the maintenance session. -->

```
<!ELEMENT rect-alts   - -    ( rect )+  >
```

```
<!ATTLIST rect-alts
          %a.node-alts;      >
```

```
<!--  This element employs the 'NODE ALTS' template from the
generic layer to facilitate the context filtering of
rectifications.  -->
```

GENERIC LAYER
TAG SET DESCRIPTIONS

101. SCOPE.

101.1 <u>Scope</u>. This appendix provides the detailed description of
the elements and attributes to be included in an IETMDB. It is
formulated as a description of possible tags or names for
components in an IETMDB whose structure is defined by the generic
layer DTD specified within Appendix A of this specification.
Unless otherwise specified by the procuring activity, this
Appendix is a mandatory part of this specification. The
information contained herein is intended for compliance.

102. APPLICABLE DOCUMENTS.

20.1   <u>Government documents </u>.

20.2   <u>Non-Government publications. </u> The following documents
form a part of this document to the extent specified herein.
Unless otherwise specified, the issues of the documents which are
DoD adopted are those listed in the issue of the DODISS cited in
the solicitation. Unless otherwise specified, the issues of
documents not listed in the DODISS are the issues of the
documents cited in the solicitation.

    ISO 8879   Information Processing - Text and Office
                       Systems - Standard Generalized Markup Language
                       (SGML)

    ISO/IEC IS10744:1992
  Information Technology - Hypermedia/Time-based Document
  Structuring Language (HyTime)

(Application for copies should be addressed to the American
National Standards Institute, 1430 Broadway, New York, NY 10018.)

103.   GENERIC LAYER TAG SET DESCRIPTIONS.

103.1   <u>Use of SGML</u>. The markup tags described herein conform to
rules defined in ISO 8879.

103.2   <u>Tag Set Descriptions</u>. Data elements shall be defined in
accordance with the tag set descriptions included below (see
3.1.2).

AGENT

Dialog Agent

<u>Descriptor</u>: Attribute
  <u>Format</u>: Character Data
<u>Template Used</u>: N/A

<u>Description</u>: Used in the **dialog** element, this attribute defines
to whom the question is asked. The value of this attribute
contains character data which identifies the person or computer
to whom the dialog should be presented. The default value is
'human'.

ASSERTION

Assertion

<u>Descriptor</u>: Element
  <u>Format</u>: N/A
<u>Template Used</u>: N/A

<u>Description</u>: This element is used to make an assertion from
within the content model of an application specific element.
Whenever an assertion appears in an element's content model,
there shall be set of semantic rules describing when the
assertion is to be evaluated. For example, under required
conditions the assertion is only evaluated when the user decides
to skip a task reference.

AUDIO

Audio Sequence

<u>Descriptor</u> : Element
  <u>Format</u> : N/A
<u>Template Used</u> :   Node, Node alts

<u>Description</u> : This element is used to hold an audio sequence.

BINOP

Binary Operation

<u>Descriptor</u> : Entity
  <u>Format</u> : N/A
<u>Template Used</u> : N/A

<u>Description</u> : This entity enumerates all of the possible binary
operators which may be used within an expression. This element
must contain one of the following elements: **eq**, **ne**, **lt**, **gt**, **le**,
ge, **and**, **or**, **xor**, **concat**, **substring**, **append**, **plus**, **minus**, **times**,
divide, **idivide**, **exponent**, **mod**, **remove**, **union**, **intersect**, **set-
diff**, **member**, **subset**, **disjoint**, **add**, **subsequence**.

CDM

CDM Template Type

<u>Descriptor</u> : Attribute
  <u>Format</u> : NAME
<u>Template Used</u> : N/A

<u>Description</u> : Used in all element declarations, to identify the generic template which the element follows. The attribute's value is a fixed default value (ie. cannot be changed by entry of another value). It is set to   **'node'** if the element follows the '**node**' template. It is set to ' **node-alts**' if the element follows the '**node alts**' template. It is set to ' **node-seq**' if the element follows the ' **node seq**' template. It is set to ' **if-node**' if the element follows the ' **if node**' template. It is set to ' **loop-node**' if the element follows the ' **loop node**' template.

CHOICE

Choice

<u>Descriptor</u> : Element
  <u>Format</u> : N/A
<u>Template Used</u> : N/A

<u>Description</u> : This element defines a choice in a menu. Choices consist of a piece of text or a graphic to be displayed. Once the user selects a choice from a menu, the presentation system will either assert some postcondition or will branch to another **dialog** (which could contain another   **menu**, **fillin** or **selection**).

CODING

Coding

<u>Descriptor</u>: Attribute
  <u>Format</u>: Character Data
<u>Template Used</u>: N/A

<u>Description</u>: Used by the **grphprim** element, this attribute
identifies the particular storage type of the current graphic
file (e.g. IGES, CGM). The default value is '   **cgmbin**'.

COLHDDEF

Column Header Definition

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: N/A

<u>Description</u>: This element defines a column header for a specific
column of tabular information.

COLNUM

Column Number

<u>Descriptor</u>: Attribute
  <u>Format</u>: NUTOKEN

<u>Template Used</u>: N/A

<u>Description</u>: Used by the **colhddef** and **entry** elements, the value
of this attribute consists of the column number of a table.

DEFAULT

Default Indicator

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data

<u>Template Used</u> : N/A

<u>Description</u> : Used by the **choice** element, this attribute contains
an enumerated list with values of either a ' **Yes**' or '**No**'.   The
default attribute provides a method of indicating whether a
choice is designated as a default for the **menu**.   The default
value for this attribute is ' **No**'.

DIALOG

User Interactive Dialogs

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : Node, Node alts

<u>Description</u> : This element provides the capability for user
interaction. A **dialog** could contain a sub **dialog**, **fillin**, **menu**,
selection, or any combination of the four. It may also contain
an optional text string which would be the title of the composite
dialog.

DIALOG-REF

  Dialog Reference

<u>Descriptor</u> : Attribute
  <u>Format</u> : IDREF

<u>Template Used</u> : N/A

<u>Description</u> : Used in the **property** element, this attribute
contains the ID of either a **dialog** element or a **process** element
which will acquire a value for the   **property**, if **property** is
undefined (ie., equal to ' **nil**') at presentation time.

ENTRY

                Column Entry Definition

<u>Descriptor</u> : Element
  <u>Format</u> : N/A
<u>Template Used</u> : N/A

<u>Description</u> : This element defines an entry for a cell in a
table. An **entry** is a piece of text and a column number.

EXPRESSION

  Expression

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : The **expression** element provides the capability to
create mathematical expressions to be used for   **preconditions** and
postconditions. There can be one of four types of expressions: a
binary operation between two expressions, a unary operation with
an expression, a property, or a value.

EXTERNAL-PTR

External Process Pointer

<u>Descriptor</u>: Attribute
  <u>Format</u>: IDREF
<u>Template Used</u>: N/A

<u>Description</u>: Used in the **audio**, **video** and **process** elements, this attribute is a pointer which points to an external file. The external file shall contain the appropriate audio, video or software process that will present to the user a multimedia event.

FILLIN

Fill In The Blank Question
<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: N/A

<u>Description</u>: This element defines a fill in the blank question. It will contain a **prompt**, a **property**, and an optional default value. The **prompt** contains the question to be presented to the user. The **property** element identifies the variable which will receive a value from the user's response. The **property** element also identifies the legal value type of the user's response. The **fillin** will be presented to the user according to the value type.

GENERIC-RANGE

Generic Range

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: N/A

<u>Description</u>: This element provides a mechanism for defining valid range checking for fillin elements. The element may identify a maximum and minimum for numeric entries or a set of valid values that may be entered for an alpha numeric entry.

GRAPHIC

  Graphic

<u>Descriptor</u> : Element
  <u>Format</u> : N/A
<u>Template Used</u> : Node, Node alts

<u>Description</u> : This element represents a composite graphic which is made up of graphic primitives (**grphprim**) or other graphic components (**graphic**).

GRPHPRIM

  Graphic Primitives

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : Node, Node-alts

<u>Description</u> : This element defines a graphic primitive to be a single graphic component which, when combined with other primitives, can become a composite graphic. A graphic primitive references a file that contains the detailed graphic information in some standard (e.g., CGM, IGES, FAX, or DXF graphic codes).

HIGH-BOUND

  High Bound

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This element identifies the maximum allowable number for a numeric entry of a fillin.

HYTIME

Hytime

<u>Descriptor</u> : Attribute
  <u>Format</u> : NAME

<u>Template Used</u> : N/A

<u>Description</u> : Used by the **link** element, this attribute is a fixed
default value (ie. cannot be changed by entry of another value).
It is set to **'ilink'**.

ID

Identifier

<u>Descriptor</u> : Attribute
  <u>Format</u> : ID

<u>Template Used</u> : N/A

<u>Description</u> : Used by elements to hold a unique identifier of a
specific element.

IF-NODE

If Node Template

<u>Descriptor</u> : Entity
               <u>Format</u> : Template

<u>Template Used</u> : N/A.

<u>Description</u> : The **if node** template provides a method of conditional branching within an interactive sequence. This template uses the same logic as the IF-THEN-ELSE statement in a programming language.

INDEX

Index

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : A signed integer value. Its meaning is dependent upon its sign. A positive value means an index position from the beginning of a **string** or **sequence**. A negative number means an index position counted back from the end of the   **string** or **sequence**. A zero means the end of the string.

ITEMID

Item Identification

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data

<u>Template Used</u> : N/A

<u>Description</u> : Used in all **node** elements to identify the
components of the system being repaired, as they relate to
information elements. The item identification attribute
specifies the reference designator(s) or other identifiable
designator(s) of the system(s), subassemblies, or parts referred
to by the element. The permissible values of this attribute are
dependant upon the content specific application using this
primitive.

LINK

Link

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This element provides the capability for creating
relational links with the data. It employs the HyTime " **ilink**"
architectural form (template) and may contain "anchors" called
(location elements) to identify two or more **linkends**. The **link**
element may contain the name of the relation (e.g., **linkterm**).

LINKEND

Link End

<u>Descriptor</u> : Attribute
  <u>Format</u> : IDREFS

<u>Template Used</u> : N/A

<u>Description</u> : Used by the **link** element, this attribute contains one or more unique identifiers (IDREFs). The identifiers shall point to a CDM element or a location element which resolves at the desired data.

LINKTERM

Link Term

<u>Descriptor</u> : Attribute
  <u>Format</u> : IDREF

<u>Template Used</u> : N/A

<u>Description</u> : Used by the **link** element, this attribute contains the ID of a specific element. This attribute points to a data item which will be used to identify a link during presentation.

LOOP-NODE

Loop Node Template

<u>Descriptor</u> : Entity
                <u>Format</u> : Template

<u>Template Used</u> : N/A.

<u>Description</u> : The **loop node** template allows for the creation of iterative loops within an interactive sequence (**node-seq**) of elements.

LOW-BOUND

  Low Bound

<u>Descriptor</u>: Element
  <u>Format</u>: N/A
<u>Template Used</u>: N/A.

<u>Description</u>: This element is used to identify the minimum
allowable entry for a numeric fillin.

MENU

                    Menu

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: Node

<u>Description</u>: This element defines a **menu** for user interaction.
It consists of a **prompt** followed by one or more **choice** elements.

MINSIZE

                Minimum Size

<u>Descriptor</u>: Attribute
  <u>Format</u>: NUTOKENS

<u>Template Used</u>: N/A

<u>Description</u>: Used in the **graphic** and **grphprim** elements, the
minsize attribute specifies the minimum viewing size at which the
graphic should be displayed. The minimum is expressed as the
width (in inches) at which the graphic should be displayed,
assuming a 36 inch viewing distance.

MODE

Mode

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data

<u>Template Used</u> : N/A

<u>Description</u> : Used in the **parameter** element, this attribute is composed of character data containing permissible values of either ' **in**','**out**', or '**in-out**'.   The default value is ' **in**'. It will indicate the method of parameter passing between the technical information and the software process.

NAME

Name

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data

<u>Template Used</u> : N/A

<u>Description</u> : Used in all **node** elements, this attribute holds the standard nomenclature for the element expressed as character data. The permissible values of this attribute depend on the specific element type.

NIL

An Empty Element

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This element represents an undefined value. Any property can take on the **nil** value.

NODE

Node Template

<u>Descriptor</u> : Entity
                <u>Format</u> : Template

<u>Template Used</u> : N/A.

<u>Description</u> : The **node** is a template by which technical information is defined. The **node** template contains the "content" of the technical information. The **node** template creates hierarchy within the CDM. The **node** template also contains context filtering preconditions and postconditions. The **link** element within the **node** template provides the capability to cross reference to other technical information. The use of **link**, from the Hytime model, provides additional functionality by allowing a link to be made to a document outside the CDM specification boundary.

The **node** template provides the capability to create composite structures within the content specific layer. Composite structures may contain subcomponents that employ the **node**, **node alts**, or **node seq** templates. The **node** subcomponents may be composite structures themselves or they may be primitive nodes (**text**, **tables**, **graphics**, **audio**, **video**, **process**). Composite structures create hierarchy within the CDM. When composite nodes contain other composite nodes there is an implied hierarchy. The composite node in the content model is at a lower level in the hierarchy (e.g. a **task node** contains **step nodes** in its content model).

NODE-ALTS

Node Alternatives Template

<u>Descriptor</u> : Entity
                    <u>Format</u> : Template

<u>Template Used</u> : N/A.

<u>Description</u> : This template shows you how to create context
sensitive filtering. This element contains one or many elements
using the **node** template. **Node-alts** (node alternatives) will
contain a list of mutually exclusive nodes. Their grouping is
due to the fact that they apply in different contextual
situations. In this manner, the   **node-alts** element is a logical
reference that contains a set of   **nodes** which might apply to
different situations. An important fact in the   **node-alts**
structure is that no hierarchy is implied between the generic
identifier and the content model   **nodes** (e.g. a **task-alts** element
will contain **task** nodes in its content model).

NODE-SEQ

Node Sequence Template

<u>Descriptor</u> : Entity
                    <u>Format</u> : Template

<u>Template Used</u> : N/A.

<u>Description</u> : The **node seq** template provides the structure for
creating interactive sequences with the user. The   **node seq**
template provides the capability to not only group elements
together, but also to preserve any inherent order/sequence which
may apply to the technical information. The   **node seq** template
also allows an author to define conditional branching and
iteration within the technical information.

NUM-RANGE

Number Range

<u>Descriptor</u> : Element
   <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This element contains the maximum and minimum
allowable values for a fillin.

PARAMETER

Parameter

<u>Descriptor</u> : Element
   <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This element will be used to pass parameters to or
from an external software **process**. For example, the 1553 bus on
an aircraft might require parameters concerning a given channel
which requires look up. The **parameter** element will contain the
channel required by the process.

PENPATT

Pen Pattern

<u>Descriptor</u> : Attribute
   <u>Format</u> : Character Date

<u>Template Used</u> : N/A

<u>Description</u> : Used in **graphic** and **grphprim** elements, this
attribute represents the bit map pattern to be used as the pen
for drawing lines, points, etc. for a particular **graphic.**

PENSHAPE

  Pen Shape

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data

<u>Template Used</u> : N/A

<u>Description</u> : Used in **graphic** and **grphprim** elements, this
attribute indicates the boundary shape for the pen for drawing
lines, points, etc. for a particular   **graphic**.

POSTCOND

  Post Condition

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : The **postcond** element asserts the value of an
expression to a **property** when the display system software
presents a **dialog** node to the user, or when a user completes some
action which needs to be recorded for later context filtering.

PRECOND

  Precondition

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : A **precond** element must contain an expression which
identifies the conditions which must be present to display the
technical information.

PROCESS

External Software Process

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : Node, Node alts

<u>Description</u> : This element will be used to represent an external software process.

PROMPT

Prompt

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This element defines the prompt to be displayed to the user for the presentation of a   **fillin** or a **menu**. It allows the prompt to be either a text string (in the form of a question) or a graphic (a picture which requires an answer).

PROPERTY

Property

<u>Descriptor</u> : Element
  <u>Format</u> : Parsable Character Data
  <u>Template Used</u> : N/A

<u>Description</u> : This element contains parsable character data which represents the property (variable) name. The value of a property may be obtained by finding the current value associated with the property name in the state table.

REF

Reference

Descriptor : Attribute
   Format : IDREF

Template Used : N/A

Description : Used in many elements, this attribute contains the
ID of a specific element. The **ref** attribute utilizes the SGML
#CONREF capability. A #CONREF attribute is only filled in when
the element's content model is empty. In this case, the #CONREF
attribute contains a reference which is a unique identifier to
either an element employing the appropriate template or a
location element that resolves to an element employing the
appropriate template (see ISO/IEC IS10744).

REMOVE

Remove

Descriptor : Element
   Format : N/A

Template Used : N/A

Description : For a **set** element the **remove** element returns a **set**
with **value** removed. For a **sequence** using the binary operand form
it returns a **sequence** which has the first instance of   **value**
removed. For a **sequence** or **string** as a unary operator remove
must contain an **index value** which refers to the position from
which the character in the **string** is to be removed or the value
in the **sequence** is to be removed. The new string or sequence will
be the old one up to but not including the index position
concatenating with the old one after the index position.

ROW

Row Number

Descriptor : Attribute
  Format : NUTOKEN

Template Used : N/A

Description : Used in the **entry** element, the value of this attribute consists of the row number for that entry's tabular information.

ROWHDDEF

Row Header Definition

Descriptor : Element
  Format : N/A

Template Used : N/A

Description : This element defines a row header for a specific row of tabular information.

SELECT

Select

Descriptor : Attribute
  Format : Character Data

Template Used : N/A

Description : Used in the **menu** element, this attribute allows the author to designate the number of choices that may be selected by the user. The choices are either '**single**' or '**multiple**', with the default selection choice being '**single**'.

SELECTION

Selection

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This element provides the capability of creating a special menu that allows selection within a given picture, text string or table.

SEQUENCE

Sequence

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This element is defined as being an ordered sequence of data.

SET

Set

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This element is defined as being an unordered sequence of data.

TABLE

Table

<u>Descriptor</u> : Element
  <u>Format</u> : N/A

<u>Template Used</u> : Node, Node-alts

<u>Description</u> : This element defines how a table is constructed. A
table will contain a column header followed by one or more
entries. The combination of column header and entries may be
repeated for as many columns as the   **table** requires.

TEXT

Text

<u>Descriptor</u> : Element
  <u>Format</u> : Parsable Character Data
  <u>Template Used</u> : Node, Node alts

<u>Description</u> : This element defines how text is constructed.
Within a text string, there may be embedded   **text** elements which
allow the referencing of other elements or parts of elements
through the link/location mechanism of HyTime.

TRANSFRM

Transformation Matrix

<u>Descriptor</u> : Attribute
  <u>Format</u> : NUTOKEN

<u>Template Used</u> : N/A

<u>Description</u> : Used in the **graphic** and **grphprim** elements, this
attribute signifies a transformation matrix which specifies
coordinate translations, scaling, or reflection and rotations in
terms of homogenous coordinates.

TYPE

Type

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data

<u>Template Used</u> : N/A

<u>Description</u> : Used in all **node** elements, the information type attribute provides a more precise mechanism for classifying an element. The permissible values of this attribute are dependant upon the content specific application using this primitive.

UNOP

Unary Operator

<u>Descriptor</u> : Entity
  <u>Format</u> : N/A
<u>Template Used</u> : N/A

<u>Description</u> : This entity enumerates all of the possible unary operators which may be used within an expression. This element could contain the following: **not**, **empty**, **size**, **head**, **tail**, **neg**, **remove**, **trunc**, **float**, **index, undef**, **max**, and **min**.

VALUE

Value

<u>Descriptor</u> : Entity
                <u>Format</u> : N/A

<u>Template Used</u> : N/A

<u>Description</u> : This entity defines an expression value. A   **value** may be a **boolean**, **string**, **sequence**, **set**, **real**, **integer**, or **nil**.

VALUE-TYPE

Value Type

<u>Descriptor</u>: Attribute
  <u>Format</u>: Character Data

<u>Template Used</u>: N/A

<u>Description</u>: Used in the **property** element, this attribute is used to denote the allowable data types which may be assigned to the property. The current legal values are any combination of the following: ' **boolean**', '**integer**', '**real**', '**set**', '**sequence**', '**string**', and '**general**'. The default value is ' **general**'.

VIDEO

Video Sequence

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: Node, Node alts

<u>Description</u>: This element will be used to include a video sequence into technical information.

WINDOW

Window

<u>Descriptor</u>: Attribute
  <u>Format</u>: NUTOKENS

<u>Template Used</u>: N/A

<u>Description</u>: Used in the **graphic** and **grphprim** elements, this attribute indicates the subrectangle within a graphic which should be displayed in those cases where the author wishes to display only a portion of a large graphic to the user.

A CONTENT SPECIFIC LAYER
TAG SET DESCRIPTIONS

101. SCOPE.

101.1 Scope. This appendix provides the detailed description of the IETM content specific elements and attributes to be included in an IETMDB. It is formulated as a description of possible tags or names for components in an IETMDB whose structure is defined by a DTD specified or developed in accordance with this specification. Unless otherwise specified by the procuring activity, this Appendix is a mandatory part of this specification. The information contained herein is intended for compliance.

102. APPLICABLE DOCUMENTS.

20.1 Government documents .

20.2 Non-Government publications. The following documents form a part of this document to the extent specified herein. Unless otherwise specified, the issues of the documents which are DoD adopted are those listed in the issue of the DODISS cited in the solicitation. Unless otherwise specified, the issues of documents not listed in the DODISS are the issues of the documents cited in the solicitation.

(Application for copies should be addressed to the American National Standards Institute, 1430 Broadway, New York, NY 10018.)

103. CONTENT SPECIFIC LAYER TAG SET DESCRIPTIONS.

103.1 Use of SGML . The markup tags described herein conform to rules defined in ISO 8879.

103.2   <u>Tag set descriptions</u> . Data elements shall be defined in accordance with the tag set descriptions included below (see 3.1.2).

ACTION

  Action

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data

<u>Template Used</u> : N/A

<u>Description</u> : Used in the **rect** element, this attribute contains character data describing the type of maintenance action required to rectify, or fix, a fault. The action can be a '   **swap**', which means it is a removal/replacement action, or it can be a '   **maint**' action, which means it is an adjustment, alignment, or similar action. The default value is ' **swap**'.

AGENT

  Agent

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data

<u>Template Used</u> : N/A

<u>Description</u> : Used in the **rect** and **test** element, this attribute contains character data describing who performs a maintenance action. It can be either a ' **human**' agent, or some valid computer system (e.g., 1553 bus) called ' **machine**'. The default value is '**human**'.

ALERT

Alert

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: Node, Node alts

<u>Description</u>: This element identifies an alert that may accompany
a task or a step. The **type** attribute may designate an alert to
be a warning, caution or note which may be displayed to the
technician. A warning notifies the technician that a task or
step may be harmful to himself or another human if not properly
performed. A caution is used in technical information to
emphasize a procedure that, if not strictly followed, or a
condition that, if not strictly maintained, may result in damage
to the equipment. A note signifies additional information which
aids the technician in completing the step or task. A note is
used in technical information to emphasize an especially
important procedure or condition.

ATTACH-PART
                    Attaching Part

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: Node, Node alts

<u>Description</u>: This element identifies all the attaching parts
required for a given part information element.

CAGE

Commercial and Government Entity

<u>Descriptor</u>: Attribute
  <u>Format</u>: NUTOKENS
<u>Template Used</u>: N/A

<u>Description</u>: Used in the **consum**, **equip** and **partbase** elements, this attribute is a five character code assigned by the Defense Logistics Services Center (DLSC) to the design control activity or actual manufacturer of an item contained in the Cataloguing Handbook H4/H8 series.

CONNECTION
Connecting Part

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: Node, Node alts

<u>Description</u>: This element is used to identify a connection between two part information elements (e.g., a connection between pin 123 and wire ABC).

CONSUM

Consumables

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: Node, Node alts

<u>Description</u>: This element identifies all the consumable required for the completion of the task.

DESCINFO

Descriptive Information

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: Node, Node alts

<u>Description</u>: The element **descinfo** is used to define general
purpose, non-procedural, narrative information such as theory of
operation, schematics, etc which are associated with a system
component. The **descinfo** element is very flexible. It can be
used to describe any arbitrary, hierarchical hypertext like node.

ESTTIME

Estimated Time

<u>Descriptor</u>: Attribute
  <u>Format</u>: NUTOKEN

<u>Template Used</u>: N/A

<u>Description</u>: Used in the **task** and **step** elements, the value of
this attribute indicates the amount of time, in minutes, required
for the corresponding task/step to be completed.

EQUIP

Equipment

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: Node, Node alts

<u>Description</u>: An **equip** element identifies the equipment needed to
perform a particular **task**. **Equip** usually refers to a piece of
test equipment, support equipment, or a tool.

FAULT

Fault

Descriptor : Element
  Format : N/A

Template Used : Node, Node alts

Description : The element **fault** is used to identify a potential failure which may occur on a weapon system.

FAULTINF

Fault Information

Descriptor : Element
  Format : N/A

Template Used : Node, Node alts

Description : The **faultinf** element is used to define all the tests and faults associated with the system that references it.

FLTSTATE

Fault State

Descriptor : Element
  Format : N/A

Template Used : Node, Node alts

Description : The **fltstate** element identifies a set of implicated or exculpated faults. Implicated faults are faults suspected of being bad; exculpated faults are faults known to be good. Each implicated fault will have a weight associated base on its likelihood of causing the discrepancy. The ' **type**' attribute will designate whether the list of faults are ' **implicated**' or '**exculpated**'.

FOLLOW-ON
Follow On Conditions

<u>Descriptor</u>: Element
  <u>Format</u>: N/A

<u>Template Used</u>: Node
                Node-alts

<u>Description</u>: A follow on condition is a maintenance condition
which must be accomplished sometime following the completion of a
task to clean up or undo actions performed during the task. For
example, in order to fix a component a task might require that an
access panel be removed. The panel would then need to be
replaced as a follow on action. This task might be performed
sometime after the repair task is completed, but not immediately
after the repair task. Other maintenance tasks might be
performed in the same area before the follow on task is
accomplished. A **follow-on** element contains a set of
preconditions which define the follow on maintenance condition
which must be satisfied, relational links, a text element which
verbally describes the follow on condition, a list of
task(s)/step(s) which provide instructions for accomplishing the
follow on condition, and a set of postconditions which define the
state changes to be made once the follow on condition is
accomplished.

FSC

Federal Stock Classification

<u>Descriptor</u>: Attribute
  <u>Format</u>: Character Data
<u>Template Used</u>: N/A

<u>Description</u>: Used in the **partbase** element, the value of this
attribute contains applicable Federal Stock Classification (FSC)
codes.

GOVSTD

Government Standard

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data
<u>Template Used</u> : N/A

<u>Description</u> : Used in the **consum** element, the value of this attribute signifies a document that establishes engineering and technical requirements for processes, procedures, practices, and methods that have been adopted as standards. It also establishes requirements for selection, application, and design criteria for materials.

HCI

Hardness Critical Item

<u>Descriptor</u> : Attribute
  <u>Format</u> : Character Data
<u>Template Used</u> : N/A

<u>Description</u> : Used in the **partbase** element, the value of this attribute represents a code which indicates that an item could degrade system survivability in a nuclear, biological, or chemically hostile environment if hardness were not considered.

ICC

Item Category Code

<u>Descriptor</u>: Attribute
  <u>Format</u>: Character Data
<u>Template Used</u>: N/A

<u>Description</u>: Used in the **equip** and **consum** elements, the value of
this attribute signifies a code which identifies a type of item,
and indicates categories into which support and test equipment,
spares, repair parts, etc. may be divided.

Note: ICCs of "A," "B," and "C" should not be assigned to
hardware items: these codes are reserved for grouping and
selecting similar ICCs during automated data processing.

Peculiar Support Equipment and Tools not
Currently in the DOD Inventory (ICC Group A):

Peculiar Support Equipment (Other)	7
Peculiar Tools	8
Peculiar Test Equipment	M
Peculiar Handling Equipment	D
Peculiar Automatic Test Equipment (ATE)	1

Common Support Equipment and Tools Currently
in the DOD Inventory (ICC Group B):

Common Support Equipment (Other)	H
Common Tools	4
Common Test Equipment	5
Common Handling Equipment	6
Common Automatic Test Equipment (ATE)	2

Common Support Equipment and Tools Currently
in the DOD Inventory but not Assigned
to a Unit/Ship (ICC Group C):

Common Support Equipment (Other)   G

Common Tools   N

Common Test Equipment   P

Common Handling Equipment   R

Common Automatic Test Equipment (ATE)   3

Bulk Items   Q

Training material not currently in the DOD
   inventory   S

Training material currently in the DOD
   inventory   T

End Item   W

Spare (repairable support item)   X

Repair part (a nonrepairable consumable support
    item, component, assembly)   Y

Repair Parts Kit   Z

A repair part, component or assembly that is

   contained in a kit/set   9

Tool Kit/Set   V

Program (Embedded software)   E

Tech Manuals   F

Forms or records   J

Electrostatic Discharge-Sensitive Item
     K

Electromagnetic-Sensitive Item

L

Facilities

U

System-Peculiar Spare Part   AA

Maintenance Significant Consumable   AB

Modified Hand Tool   AC

Maintenance Assist Module   AD

INDEXNUM
Index Number

Descriptor : Attribute   Format : NUTOKENS

Template Used : N/A

Description : Used in the **partinfo** element, the value of this
attribute contains the index number for the part which represents
a callout in a graphic output onto paper.

INPUT
Input Conditions

Descriptor : Element   Format : N/A

Template Used : Node, Node alts

Description : The **input** element contains the personnel required,
the consumable used, the equipment used and the required
conditions for accomplishing a given task.

LOCATION
  Part Location

Descriptor : Element   Format : N/A

Template Used : Node, Node alts

Description : The **location** element provides information for physical assessment. It will contain x, y, z location(s) for a system with respect to the x, Fuselage Station (FS), y, Buttock Line (BL), and z, Water Line (WL) reference system. Where appropriate BL may be replaced by Wing Station (WS).

LOCATION-X   **Location X**

Descriptor : Attribute   Format : NUTOKENS

Template Used : N/A

Description : Used in the **location** element, the value of this attribute contains a number representing a position on the Fuselage Station (FS), which is used as the x-axis of the weapon system.

LOCATION-Y   **Location Y**

Descriptor : Attribute   Format : NUTOKENS

Template Used : N/A

Description : Used in the **location** element, the value of this attribute represents a position on the Buttock Line (BL), which is used as the y-axis of the weapon system.

LOCATION-Z   **Location Z**

<u>Descriptor</u> : Attribute   <u>Format</u> : NUTOKENS

<u>Template Used</u> : N/A

<u>Description</u> : Used in the **location** element, the value of this attribute contains a number representing a position on the Water Line (WL), which is used as the z-axis of the weapon system.

LRU

                                              Line Replaceable Units

<u>Descriptor</u> : Attribute   <u>Format</u> : Character Data
<u>Template Used</u> : N/A

<u>Description</u> : Used in the **partinfo** element, this attribute signifies an essential support item that is removed and replaced at field level to restore the end item to its operationally ready condition. Allowable values are:

   Item is a LRU

                                     Y

   Item is not a LRU
   N

MFGCODE
   Manufacturers Codes

<u>Descriptor</u> : Attribute   <u>Format</u> : Character Data
<u>Template Used</u> : N/A

<u>Description</u> : Used in the **consum** element, the value of this attribute indicates the in house code a manufacturer uses to represent parts.

MILSPEC
  Military Specification

Descriptor : Attribute   Format : Character Data
Template Used : N/A

Description : Used in the **consum** element, the value of this
attribute represents the exact specification for each item bought
by the government.

MTBF
                                    Mean Time Between Failure

Descriptor : Attribute   Format : Character Data
Template Used : N/A

Description : Used in the **fault** and **partinfo** elements, the value
of this attribute signifies, for a particular interval, the total
functional life of a population of an item divided by the total
number of failures within the population during the measurement
interval. The definition holds for time, rounds, miles, events,
or other measure-of-life units.

NOUNID
  Noun Identifier

Descriptor : Attribute   Format : NUTOKEN

Template Used : N/A

Description : Used in the **partinfo** element, the value of this
attribute indicates a general name of a part.

NOUNTYPE
  Noun Type

Descriptor : Attribute   Format : NUTOKEN

Template Used : N/A

Description : Used in the **partinfo** element, the value of this attribute signifies more specific descriptors which differentiate part names.

NSN

                              National Stock Number

Descriptor : Attribute   Format : Character Data
Template Used : N/A

Description : Used in the **equip**, **consum** and **partbase** elements, the value of this attribute is a number, assigned under the Federal Cataloguing Program and/or North Atlantic Treaty Organization (NATO) codification of equipment system to each approved item, which provides a unique identification of an item of supply within a specified FSC. The field consists of a three character prefix, a thirteen character NSN, and a four character suffix code. For applicable codes, see DOD 4100.38-M.

OPERABILITY   **Operability**

Descriptor : Attribute   Format : Character Data
Template Used : N/A

Description : Used in the **task** element, the value of this
attribute is a code used to indicate the operational status and
mission readiness of the system during the maintenance task.
Allowable values are:

  Full Mission-Capable: performance of the
  maintenance task does not degrade any mission
  capability.
  C

  Partial Mission-Capable: performance of the
  maintenance task degrades the mission capability
  of the system, but can perform at least one
  mission.
  D

  System Inoperable During Equipment Maintenance:
  system is not available to perform all normal
  operations.   A

  System Operable During Equipment Maintenance:
  system is available to perform normal operations.   B

  Not Mission-Capable: system cannot perform any
  missions.   E

  Off-Equipment Maintenance: task is performed after
  the item under analysis has been removed from the
  system.   G

  Turnaround: task occurs during normal turnaround
  operations, and does not affect the operability of
  the system.   F

OUTCOME

  Outcome

<u>Descriptor</u> : Element   <u>Format</u> : N/A

<u>Template Used</u> : Node, Node alts

<u>Description</u> : This element represents a possible outcome from a test. It identifies a fault state
(**fltstate**) for use in a dynamic fault model, and a   **test** or **fault** for the static tree model.

PARA
  Para

<u>Descriptor</u> : Element   <u>Format</u> : N/A

<u>Template Used</u> : Node, Node alts, Node seq, If node, Loop node

<u>Description</u> : Identifies a piece of text to be displayed under the **descinfo** element. The text may be "Theory of Operation", "General Information", etc.

PARTBASE
  Part Base

<u>Descriptor</u> : Element   <u>Format</u> : N/A

<u>Template Used</u> : Node

                              Node-alts

<u>Description</u> : This element describes the supply system's view of the part information. It describes the item in terms of its part number.

PARTINFO
  Part Information

Descriptor : Element   Format : N/A

Template Used : Node, Node alts

Description : This element describes the maintainer's view of the
part information. It identifies parts information within its
relative position in the weapon system.

PARTNUM
  Part Number

Descriptor : Attribute   Format : Character Data
Template Used : N/A

Description : Used in the **partbase** element, this attribute
signifies any number, other than a government activity stock
number, used to identify an item of production or supply.

PERSON
  Person

Descriptor : Element   Format : N/A

Template Used : Node

                                        Node-alts

Description : This element is used to identify the personnel
requirements for a given task.

QUANTITY
  Quantity

Descriptor : Attribute   Format : NUTOKEN

Template Used : N/A

Description : Used in the **person**, **equip**, **expend** and **consum** elements, the value of this attribute signifies the amount of the appropriate consumable, equipment, or people required for the associated **task**/**step.**

RANGE
  Range

Descriptor : Attribute   Format : Character Data
Template Used : N/A

Description : Used in the **test** element, this attribute represents the boundaries for valid choices or outcomes, according to the element containing the range.

RECT
  Rectification

Descriptor : Element   Format : N/A

Template Used : Node, Node alts

Description : The **rectification** element identifies the prescribed task that will repair the fault causing the discrepancy and all other faults that could be fixed by the rectification. Upon completion of the task, a test is performed to verify the effect of the rectification.

REFDES
  Reference Designation

Descriptor : Attribute   Format : NUTOKEN

Template Used : N/A

Description : Used in the **partinfo** element, this attribute is an
identifier assigned according to a numbering scheme for parts of
a system which reflects the hierarchical assembly of the system.

REPLVL
  Replenishment Level

Descriptor : Attribute   Format : Character Data
Template Used : N/A

Description : Used in the **partinfo** element, this attribute
represents the minimum quantity of a part in stock that will
trigger a reorder or stock action.

REQCOND
  Required Conditions

Descriptor : Element   Format : N/A

Template Used : Node, Node alts

Description : A **reqcond** element contains a list of preliminary
conditions which must be met prior to beginning a   **task**. If any
condition is not met, it contains the   **task** or **step** which will
satisfy the condition. It also contains   **postcondition**s which
will record the state changes made in satisfying the conditions.

SERVICEDE   **Service Designator**

Descriptor : Attribute   Format:Character Data
Template Used : N/A

Description : Used in the **task** element, this attribute is a
single position code identifying the military service or
nonmilitary major governmental agency having jurisdiction over,
or executive management responsibility for, the acquisition.
Allowable values are:

Army	A
Air Force	F
Marine Corps	M
Navy	N
Coast Guard	Y
All Military	X
Federal Aviation Administration	T
FAA/All Military	J
National Security Agency	S
Other	O

SMR

                                              Source,

Maintenance, Recoverability Codes

Descriptor : Attribute   Format : Character Data
Template Used : N/A

Description :

Used in the **partbase** element, SMR codes are alphabetic or
alphanumeric symbols used at the time of provisioning to indicate
the source of supply of an item, its maintenance implications,
and its recoverability characteristics. The provisioning
activity may require the contractor to recommend these codes.
Approved codes are defined in: AR 700-82, OPNAVINST 4410.2, AFR
66-45, MCO 4400.120, and DSAR 4100.6.

STEP
  Step

Descriptor : Element   Format : N/A

Template Used : Node, Node alts, Node seq, If node, Loop node

Description :

The **step** element is the primary component of a maintenance
procedure. It describes the actions to be performed in order to
successfully complete a task.

SYSTEM
  System

Descriptor : Element   Format : N/A

Template Used : Node, Node alts

Description : The **system** element defines the
vehicle/system/subsystem/subassembly hierarchy for the weapon
system. A **system** element must be created for any component (ie.,
vehicle, system, subsystem, subassembly) which has associated
technical information (ie., descriptive, procedural, fault, or
part information).

TASK
  Task

<u>Descriptor</u>: Element   <u>Format</u>: N/A

<u>Template Used</u>: Node, Node alts

<u>Description</u>: The **task** element is a set of directive steps which make up a specific maintenance procedure. A maintenance procedure could be a preventive or corrective maintenance task. Preventive tasks are preformed at regular intervals to ensure that the item or system will continue to operate correctly and safely (such as inspect, clean, lubricate, etc). Corrective (or unscheduled) maintenance procedures are performed when required to repair faulty items or systems that have been identified by troubleshooting procedures. A procedural task is made up of steps, and ties all text, graphics, messages, prompts, and references required to convey the step together. A   **task** element contains linking information necessary to link one   **task** to other **task**s.

TECHINFO
  Technical Information

<u>Descriptor</u>: Element   <u>Format</u>: N/A

<u>Template Used</u>: N/A

<u>Description</u>: This element represents the top layer of the information contained in this content specific DTD. The content model contains the top level system such as "F-15", "M-1" or "F/A-18".

TEST
  Test

Descriptor : Element   Format : N/A

Template Used : Node, Node alts

Description : This element indicates a diagnostic test that will lead to outcomes and guide the technician toward a rectification during troubleshooting.

UNIT-OF-MEASURE   **Unit of Measure**

Descriptor : Attribute   Format : Character Data
Template Used : N/A

Description : Used in the **consum** element, this attribute identifies the type of unit measurement used to quantify the number of consumables needed for the current application. (e.g., "inches", "meters", "pounds", etc.).

UNITSPER
  Units per Assembly, System, etc.

Descriptor : Attribute   Format : NUTOKEN

Template Used : N/A

Description : Used in the **partinfo** element, this attribute represents the number of units required per assembly of a system or component.

USABLEON
  Usable On Code

Descriptor : Attribute   Format : NUTOKEN

Template Used : N/A

Description : Used in the **partinfo** element, this attribute identifies the different configurations in which a part or assembly may appear within a system or vehicle.

VERSION
  Version

Descriptor : Element   Format : N/A

Template Used : Node

Description : This element identifies the currency of the data by providing the last revision information and change information necessary for taking delivery of partial databases.

WEIGHT
  Fault Probability

Descriptor : Attribute   Format : NUTOKENS

Template Used : N/A

Description : Used in the **fltstate** element, this attribute represents a probability associated with a given **fault** within a list of **fault**s in a fault state (**fltstate**).
